pigmentosa-deafness syndrome 1. In addition to gene therapy for this disease, the protein, nucleic acid and antibodies can be used to diagnose and treat myocardial infarction, congestive heart failure, hypertrophic cardiomyopathy, dilated myopathy, to limit infarct size following a heart attack, to aid recovery after heart transplantation, to promote angiogenesis and wound healing, to develop coronary collateral circulation, for revascularisation in the eye, for
                                                                                                                                                                                                                                                                                      similar to proteins with a RING finger sequence, with the full length clone being obtained from a peripheral blood granulocyte library. BRCA is an example of a RING finger protein. The gene is found on chromosom 9q43.11, and its looms is assectional.
                                                         complications related to poor circulation, for stroke, induction of skeletal muscle neogenesis and/or hyperplasia, kidney regeneration and treatment of systemic and pulmonary hypertension. In addition to a RING finger domain, the protein also contains eight leucine rich repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotides encoding zapop3 polypeptides useful for detecting chromosomal abnormalities comprising a sequence identical to a specific amino acid sequence, identity being determined by a specific program -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (MIZU/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a gene encoding a subunit of the cellulose synthates complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 10732 BP; 3149 A; 1212 C; 2074 G;

                                                                                                                                                               Q
                                                                                                                                                                                                                                                                                   expression of genes in a first filamentous fungal (FF) cell relative to cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS cere used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the cere same genes in one or more second filamentous fungal cells. Monitoring the global expression of genes from FF cells allows the production of the global expression of genes from FF cells allows the production of contential of the microorganisms to be improved. New genes may be cell dentified and gene copy number variation and stability can be cell dentified and gene copy number variation and stability can be cell consitored. The expression of genes can be used to study how FF cells capt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PA PA XX
                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                Using ESTs provides several advantages over genomic or random cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. F07478 to F11247 represents ESTs from Fusarium venenatum; F11248 to F11853 represents ESTs from Aspergillus niger; F11854 to F14878 represents ESTs from Aspergillus oryzae; and F14879 to F15337 represents ESTs from Trichoderma reesei, which are all

                                                                                                                                                                                                                                                                                               invention relates to a method of detecting and characterising a stealth virus by reacting a sample suspected of containing a stealth virus with a probe from a known stealth virus and sequencing the resultant isolated nucleotide. The method comprises the steps of: (a) isolating DNA or RNA from a sample suspected of containing a stealth virus, e.g. a culture of cells showing a viral cytopathic effect; (b) testing the reactivity of the isolated DNA or RNA with a molecular probe that contains at least 18 or more contiguous nucleotides identical to sequence previously identified from a stealth virus; and, optionally (c) sequencing the isolated DNA or RNA molecules that react with the probe. The method is used to detect stealth virus in a biological product, food or in the next of the probe of the probe of the probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Location/Qualifiers misc_difference 2167

                                                                                                                                                                                           cancer. The polypeptides and monoclonal antibodies specific for the polypeptides can also be used to inhibit the development of lung cancer. Agents which bind the polypeptides can be used for detecting lung cancer and for monitoring the progression of lung cancer.

The polypeptides and polypucleotides are used in compositions and vaccines to inhibit the development of cancer, especially lung cancer, in a patient. Methods described in the invention can be used to monitor the progression of a cancer by carrying out the detection at subsequent time points and comparing the results from the different time points. CD4+ and/or CD8+ T-Cells isolated from a patient are treated with P2, polynucleotides encoding P2 or antigen presenting cells expressing P2 and then administered to the patient to inhibit development of cancer.

The gene was named Lg-FLO1. The FLO1 protein is believed to be involved in yeast flocculation (aggregation). The DNA and protein are used if a method for determining whether or not a sample yeast has flocculating activity, i.e. to distinguish if a yeast is a flocculating or floating yeast.

                                                                                                                                               A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X1938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as consigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-NOV-1997;

It currently consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Chemistry: Dye-primer ET; 100% of reads Chemistry: Dye-terminator Big Dye; 0% of read Chemistry: Dye-terminator Big Dye; 0% of read Assembly program: Phrap; version of 0.990319 Consensus quality: 150364 bases at least Q30 Consensus quality: 154713 bases at least Q30 Consensus quality: 156776 bases at least Q20 Consensus quality: 156776 bases at least Q20 Center: Washington University Genome Center code: WUGSC Quality coverage: 4.80 in Q20 bases; agarose-fp Quality coverage: 5.08 in Q20 bases; sum-of-contigs Web site:http://genome.wustl.edu/gsc/index.shtml Insert size: 157000; agarose-fp Insert size: 160493; sum-of-contigs arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence. NOTE: This is a 'working draft' sequence. It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is as soon as it is available and the accession number will be preserved. vector: plasmid; gap of contig gap of contig gap of contig contig gap of contig contig of 3224 bp in length gap of unknown length contig of 3474 bp in length contig gap of contig gap of gap of contig gap of unknown of 9616 unknown of 5080 unknown of 5075 unknown of 5609 unknown unknown length of 29836 bp in length of 9761 unknown of 2588 unknown length bp in 1 length bp in length bp in length length bp in bp in length bp in length bp in length length length length reads length length length

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Project Information
                                                                                                                                                           NOTE: This is a 'working draft' sequence. It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
                                                                                                          as soon as it
be preserved.

Genes with similarity to proteins in the databases are described a
'putative', '-like' or 'similar to'. Genes that have EST
similarity but no significant protein similarity are described as
'unknown proteins'. Genes that are annotated based only on gene
prediction software are described as 'hypothetical proteins'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
